

# Überprüfen Sie Anzahl und Größe der NetWorker Logdateien auch auf Ihren Storage Nodes!

Ursächlich für diesen Tip war das Problem, daß ich in meinem Tip *9xxgen\_45.pdf* beschrieben habe.

Hier zeigte der Blick in das Log-Verzeichnis, in dem mit der aktuellen Einteilung für diesen Server/NetWorker Storage Node bereits mehr als 1 GB an Log-Informationen gespeichert waren:

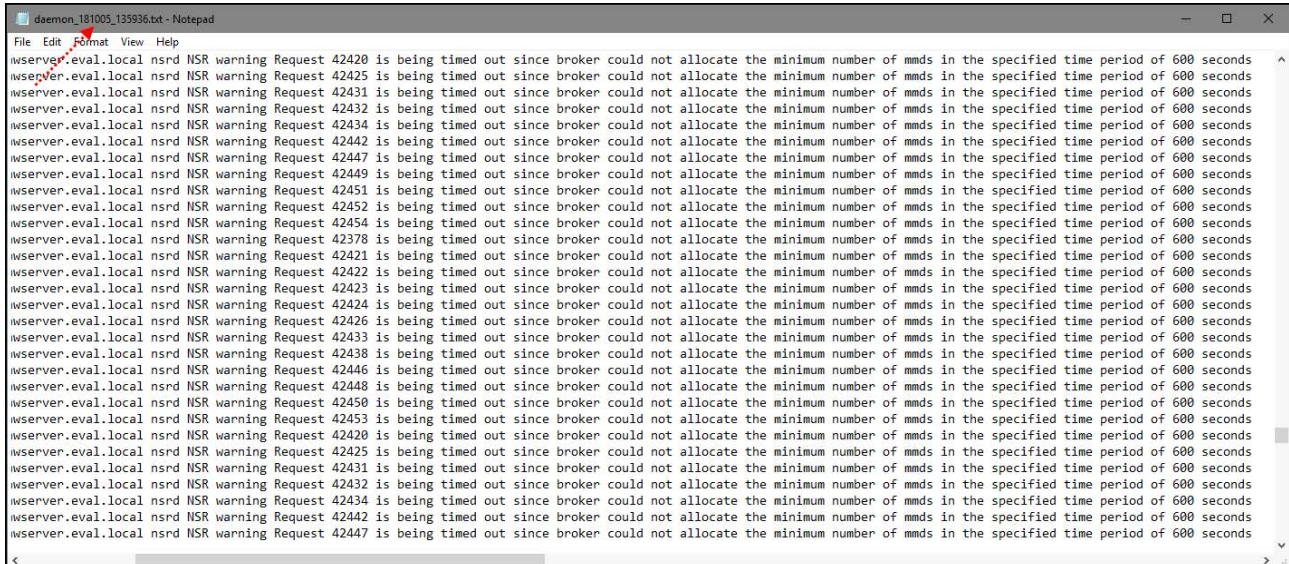

Der Fehler hatte also jede Menge Informationen geloggt - doch er war so leistungsstark, daß ihn das bei seinen sonstigen Aktivitäten offenbar gar nicht gestört hatte. Allerdings müssen Sie beachten:

- Bei einem schwächeren Storage Node kann ein solches Problem seine Arbeit evtl. behindern.
- Mit anderen Einstellungen für den Umbruch der Datei `daemon.raw` könnte es durchaus sein, daß Ihre NetWorker Platte irgendwann voll wird!

Doch wann war dieser Fehler erstmalig aufgetreten? - Zum Glück gab ja tägliche Backups, auch vom Storage Node. Und so fand ich ich heraus, ...

- daß der Fehler bereits seit Tagen existierte (erstmalig wurde er am 05.10.2018 registriert).
- daß der NetWorker Eintrag in der Log-Datei sogar mehrmals in der Sekunde vorhanden war - deshalb wuchs auch die Datei `daemon.raw` so schnell und gewaltig an:

```

Deshalb habe ich vorsichtshalber ein Script programmiert, daß mich täglich warnt, sollten mehr als 3 `daemon*.raw` Dateien auf den Storage Nodes existieren. Dies sollten Sie vielleicht auch tun.
