

# Mit der NMM Version 3.0.0 lassen sich Exchange Datenbanken wiederherstellen, dann aber nicht mounten

Die Meldung in den Logs ist eindeutig. Bei näherer Untersuchung im Event Manager fallen dann u.a. auch diese Einträge auf:

## EventID 9519

"The following error occurred while starting database RDB####: Database is in inconsistent state. Failed to configure MDB. „

## EventID 3154

"Active Manager failed to mount database RDB#### on server *exchange\_client*.  
Error: An Active Manager operation failed. Error The database action failed. Error: Operation failed with message: MapiExceptionCallFailed: Unable to mount database. (hr=0x80004005, ec=-550)."

## EventID 209

"At '09.10.2013 11:17:59' the Exchange store database 'RDB####' copy on this server detected corruption on the active copy of the database. To help identify the specific failure, consult the Event log on the server for other storage and "ExchangeStoreDb" events. Service recovery was attempted by failover to another copy, which was unsuccessful in restoring the service. Error: There is only one copy of this mailbox database (RDB####). Automatic recovery is not available."

Das Problem ist bei EMC bekannt. Ein kleiner Hotfix behob das Verhalten sofort.
